

SIGNS FOR THE VISUALLY IMPAIRED.

Raised text and braille can be applied to nearly all standard Interior and Exterior sign products allowing users to create a coherent design which integrates braille and non braille signs without compromising the overall aesthetic of the signage scheme.

In order to support the needs of visually impaired visitors it is also advised that signs be produced with good contrast between letters and background, which should also contrast well with the background upon which it is mounted.

Tactile characters from Modulex are typically raised by 0.8 mm [0.0315], sufficient to support the requirements of visually impaired users.
